ABSTRACT

1
2 A sound source apparatus has operation blocks composed of softwares
3 used to compute waveforms for generating a plurality of musical tones through
4 a plurality of channels according to performance information. In the apparatus,
5 a setting device sets an algorithm which determines a system composed of
6 selective ones of the operation blocks systematically combined with each other
7 to compute a waveform specific to one of the musical tones. A designating
8 device responds to the performance information for designating one of the
9 channels to be used for generating the musical tone. A generating device
10 allocates the selective operation blocks to the one channel and systematically
11 executes the allocated selective operation blocks according to the algorithm so
12 as to compute the waveform to thereby generate the musical tone through the
13 channel. The generating device responds to a variable sampling frequency for
14 executing the operation blocks to successively compute samples of the
15 waveform in synchronization to the variable sampling frequency so as to
16 generate the musical tone, and sets the variable sampling frequency according
17 to process of computation of the waveform by the operation blocks.
